

Employee Attrition — Findings Summary

Prepared for HR Leadership | Based on analysis of 1,470 employee records

What We Did

We analysed historical HR data to identify which employees are most at risk of leaving — and why. The goal is to give HR a heads-up before someone hands in their notice, so the right conversations can happen at the right time.

Key Numbers

Metric	Finding
Overall attrition rate	16.1% — 237 out of 1,470 employees left
Highest-risk department	Sales (20.6% attrition)
Highest-risk job role	Sales Representative (39.8% attrition)
Income gap	Leavers earned ~\$2,000/month less than those who stayed
New hire attrition (0–2 yrs)	33% — 1 in 3 new hires leave within 2 years
Poor work-life balance	31.3% attrition — nearly double the company average

What Is Driving People to Leave?

Pay. Employees earning below the company median are significantly more likely to resign. The income gap between those who left and those who stayed averages over \$2,000 per month — pay is the strongest single driver.

Overwork. Employees required to work overtime consistently show much higher exit rates. Burnout is nearly as strong a driver as salary, which means raising pay alone will not fix the problem if workload stays the same.

Early career stage. Employees in their first two years are three times more likely to leave than long-tenured staff. The first year is the most critical window for retention.

Two Actions HR Can Take Now

1. Check in with overtime Sales staff within 30 days. Sales Representatives have the highest exit rate in the company (39.8%). Those also working overtime are the single highest-risk group. A short, informal conversation — not a performance review — focused on workload and wellbeing would go a long way. Pairing this with a clearer overtime compensation policy would address both drivers at once.

2. Add structure to the first year for every new hire. Assign a mentor from day one, schedule check-ins at 30, 60, and 90 days, and have a career path conversation by month three. Employees who feel supported early are far less likely to start looking elsewhere.

A note on how to use this: This analysis flags patterns and risk — it is not a definitive list of people who will leave. It should be used to start supportive conversations, not to make assumptions or reduce someone's opportunities.
